INTRODUCTION

This is the sixth edition of the Statistical Abstract of Louisiana published by the Division of Business and Economic Research, College of Business Administration, University of New Orleans. It is the only reference work of its kind about Louisiana. The response to the previous editions was most encouraging; it is apparent that there is a continuing need for the current edition.

The sixth edition has been enlarged and improved in many respects. Many new tables have been added on new subjects, e.g., land use in Louisiana and its parishes. In addition to reproducing and updating tables that appeared in the fifth edition, this volume contains all of the relevant data from the 1970 Census, as well as available data subsequent to the 1970 Census.

The purpose of the Abstract is to provide the user with a compilation of an extensive amount of pertinent data about Louisiana and its subdividions--cities, metropolitan areas, state planning districts, and parishes. The statistical information included in the Abstract was taken from diverse sources; consequently, the user has available to him, in one convenient volume, data on Louisiana which would otherwise require an enormous expenditure of time and energy to collect. The sources of the data have been cited, but the compilers assume responsibility only for errors in reproducing and manipulating the materials used. Responsibility for the accuracy of the original data, of course, belongs to the original sources.

A continuing effort will be exerted to make the Statistical Abstract of Louisiana as useful as possible. As a means of achieving this goal, users are invited to suggest additional material for inclusion in subsequent editions. The Louisiana State Planning Office, for example, reviewed previous editions and made invaluable suggestions for new material included in this volume. Other suggestions for improvement are also solicited.

Recognition and appreciation must be extended to those who made this edition possible. Theresa Crafts had a major role in directing the preparation of the sixth edition. She assumed primary responsibility for the numerical content of each table, as well as suggesting tables for inclusion. Her long hours of devoted labors are reflected in the many improvements in this edition. The tedious, but critically important, task of proofreading was performed by Khanit Khongthanarat and Robert Wellston. The always laborious, and sometimes thankless, task of typing the Abstract, as well as responsibility for consistency of format, was completed expertly by Bridget P. Dawson, who was assisted by Cynthia Chester and Tessie Fleming. Appreciation also must be extended to Frances W. Skiffington of the Earl K. Long Library for her enthusiastic and tireless efforts in securing data sources.

An especial recognition and appreciation must be extended to Dr. John E. Altazan, Dean of the College of Business Administration, for the encouragement that he gave when the first edition was initiated in 1965. Otherwise, there would have been no Statistical Abstract of Louisiana.

[1] Figures after 1940 not comparable with previous figures because of change in urban definition.

[2] These figures contain minor errors made by the U.S. Census Bureau during tabulation of the 1970 source material. The sum of the parish detail information, for Louisiana, falls short of the corrected State total by 1,874 persons. This amounts to 0.05 percent of the corrected State total. The corrected detailed information was not available at the time of this compilation.

[1] "A Standard Metropolitan Statistical Area (SMSA) is a county or group of contiguous counties (except in New England) which contains at least one central city of 50,000 inhabitants or more or 'twin-cities' with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city." This classification was first employed in 1960.

[2] See Footnote 2, Table I-4, Page 4.

[3] All figures except "Inside Central City" are computed, according to the SMSA definition as of January 1, 1974.

[4] Less than 0.05 percent decrease.

[1] The scale values shown here are percentages to be applied to the total cost of consumption of the base family (4 persons — husband, age 35-54, wife, 2 children, older 6-15 years) to estimate the annual costs of goods and services required to provide the same level of living for urban families of different size, age, and composition. The values may also be applied to after-tax income, i.e., family income after deduction of income and other personal taxes.
